

More Info on DXER RESONANT KAPANADZE:

1. X coil resonates fine with 166-167 turns.
2. X coil resonates better if more turns are on the borders than in the center.
3. For more power and a bit different sinus shape utilize switching supply.
4. You can use Noplis for supply output cap also with additional capacitor on plus line.
5. AC OUT ~1 Earthed.
6. Works with extra groundings and negative return.
7. You can give up to four of such generators in parallel.

- I. 22nF between base-collector
- II. Add heatsinks on transistors (I am proposing 2N3055)
- III. Transistor can be opened with 2M ohm between base-emitter.

Typical result is 1-3kW of power.
