

JUST DON'T DO THIS!

1. To take signal for step up transformer between L and R channels.
2. To put resistors lower than 3k on an electrolytic cap.
3. To put artificial phase into grid line.
4. To connect AC transformer output into case (without a cap in series).
5. To put Modo output into Grid Line Phase (input).

You can mess with Neutral as much as you like... Even ground it somehow to save the power bill.

But leave the phase alone.

Don't make Secret Service into attention... They love to walk in abnormal houses...

Greetings! dxer_87
